Module 4

THEORETICAL GROUNDING AND PRINCIPLES OF TRIZ

*...The problems that exist in the world today cannot be
solved by the level of thinking that created them...
attributed to Albert Einstein*

Dmitry KUCHARAVY, dmitry.kucharavy@insa-strasbourg.fr

LGECO - Laboratory of Engineering Design
INSA Strasbourg - Graduate School of Science and Technology
24 boulevard de la Victoire, 67084 Strasbourg Cedex, France

July, 2006

objectives of the course

- **Understand** the fundamental differences between TRIZ and conventional approaches to inventive problem solving.
- **Practice** contradiction formulation and 40 Inventive Principles.
- **Learn** about Three basic concepts of OTSM-TRIZ and their corollaries.
- **Understand** the basic principles and inventive problem solving process applied for various TRIZ methods.
- **Realize** the scope of usage of the 40 Inventive Principles and formulate their limitations.

course contents

1. INTRODUCTION
2. 40 INVENTIVE PRINCIPLES
3. THREE BASIC CONCEPTS
4. Mental Inertia & Creative Imagination
5. Problem Solving Process
6. APPLICATION OF TRIZ KNOWLEDGE

overview of the session's program

- Day One:** INTRODUCTION; Case example "Wire spool";
Learners' specific cases.
- Day Two:** 40 INVENTIVE PRINCIPLES; Case examples;
Work on specific cases.
- Day Three:** THREE BASIC CONCEPTS; Case examples;
Work on specific cases.
- Day Four:** Mental Inertia & Creative Imagination;
Work on specific cases.
- Day Five:** PROBLEM SOLVING PROCESS; APPLICATION OF
TRIZ KNOWLEDGE
Presentation of case study results; Summary of
the course.

INTRODUCTION

*...It is not the problem that breaks you down, it is the way you approach it...
(ancient wisdom)*

- ❑ Why is it difficult to solve problems?
- ❑ The Key Task of the problem solving process
- ❑ about TRIZ

invention is...

...Each invention is a road through the 'impossible'.

Generally, 'impossible' signifies only 'impossible by existing means'.

The inventor must find a new concept, and then the impossible becomes possible...

G. Altshuller

Shape of the Earth

Is it possible to prove that the Earth is spherical without using any devices?

Aristotle* (384-322 BC) did it.

How did he prove this fact?

Module 4: Theoretical grounding and principles of TRIZ

* an ancient Greek philosopher, a student of Plato and teacher of Alexander the Great

Monterrey, Mexico - INSA Strasbourg, France | July 2006

7

lost spacecraft

A spacecraft is "lost" in outer space.

There is no radio signal, however the approximate location in space is known. Several photographs were taken of that area in space.

How does one trace the spacecraft faster?

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

8

why is it difficult to solve problems?

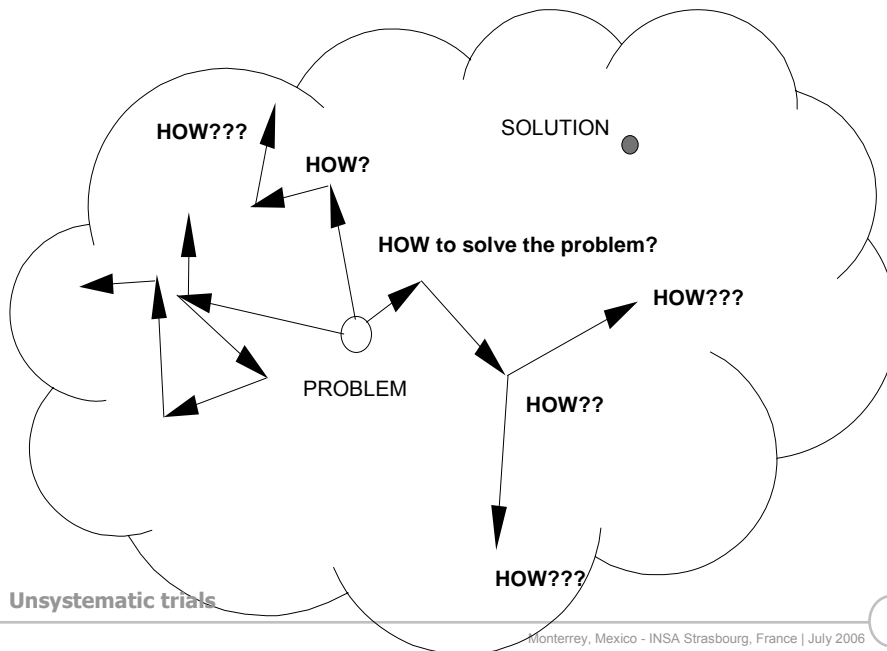

Please discuss in a team and compile a list of the causes.

Note the most important causes first:

1. _____
 2. _____
 3. _____
 4. _____

Module 4: Theoretical grounding and principles of TRIZ

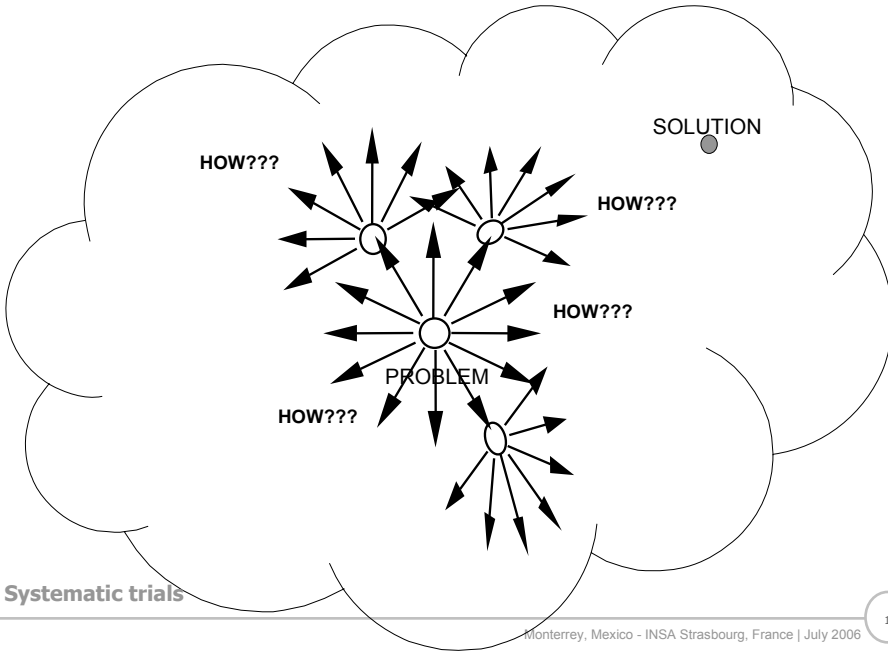

how do we look for the solution to a problem?

Module 4: Theoretical grounding and principles of TRIZ

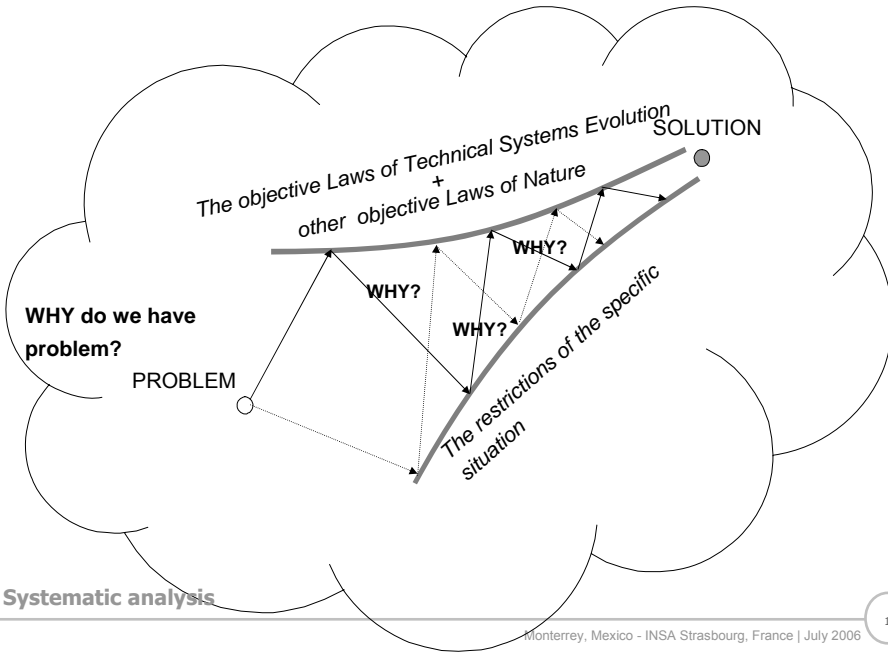

how do we look for the solution to a problem?

Module 4: Theoretical grounding and principles of TRIZ

how do we look for the solution to a problem?

Module 4: Theoretical grounding and principles of TRIZ

how do we look for the solution to a problem?

Module 4: Theoretical grounding and principles of TRIZ

DIFFERENT STRATEGIES:

- ❑ **Unsystematic Attempts**
 - HOW to solve the problem?
 - Guessing the Answer. Trial and Error
- ❑ **Systematic Attempts**
 - HOW to find a solution?
 - Search for Solutions.
 - Intensified Trial-and-Error process
- ❑ **Systematic Analysis of the problem situation**
 - WHY do we have a problem?
 - Developing the Solution.
 - Reduced area of research.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

Auguste Piccard* balloon

Module 4: Theoretical grounding and principles of TRIZ

Ascent of a Piccard balloon
Credit: UPI--EB Inc.

On May 27, 1931, Piccard and Paul Kipfer reached an altitude of 15781m, where the atmospheric pressure is about 1/10 that at sea level. In order to ascend it is required to unload something. However, unloading something above cloud level was unsafe for people on the ground.

What should be done?

<The unloaded object> must be <heavy>, in order to <decrease the weight of the balloon system>, BUT <the unloaded object> must not be <heavy>, in order to <be safe for people>.

* physicist, aeronaut, balloonist, hydronaut

Monterrey, Mexico - INSA Strasbourg, France | July 2006

15

how to find a number?

Task: You must find an integer in the range from 0 to 1000 as quickly as possible.

What should be done?

Let us use a simple rule:

- for each step, it is necessary to subdivide the section of numbers into equal sections.

Pattern of questioning: *Is the unknown number less than the middle of the section?*

1. Is the unknown number less than 500? – Yes / No
2. Is the unknown number more than 750? – Yes / No
3. Is the unknown number less than 625? - Yes / No.

.....
At step #11 we will know the unknown number. **Guaranteed!**

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

16

why do we have difficulties?

How to <reduce the Research area into the Solutions Area>
 without <considerable trial and error
 and mental inertia restrictions>
 without <degrading the power of the solution?>*

THE KEY TASK of the problem solving process

It is necessary to sort out carefully and systematically all possible and impossible concepts, **because** <it is quite possible to miss useful solutions>; <it is necessary to overcome mental inertia>.

But it is necessary to exclude a careful, systematic and exhaustive search, **because** <it is required to reduce the expense of the solution>; <we do not have the time, knowledge and other possibilities necessary for estimating all solution concepts>.

17

how to find a city?

different strategies

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

18

summary

- ❑ **The difficulty of developing a solution concept is based on the limits of available resources of time, knowledge, and mental inertia restrictions.**
- ❑ **In order to make the transition from unsystematic attempts to the systematic analysis of the Problem Situation it is useful to ask strong WHY questions (i.e. Why do we have such a problem?) instead of HOW to perform the solution.**
- ❑ **In order to develop a strong conceptual solution the problem solving strategy has to reduce the research area for each step of analysis instead of enlarging the number of variants.**

about TRIZ

"TRIZ is a tool for thinking but not instead of thinking".

Boeing

BOEING'S PROPOSED 767 TANKER

Boeing's 767 program has gotten a significant boost with the launch of a new air refueling tanker. The tanker, still in the design stages, could have the capacity to carry up to 32,050 gallons of fuel on its lower deck and could be equipped with three aerial refueling pods. The main deck will be configured to transport both passengers and cargo.

TRIZ is...

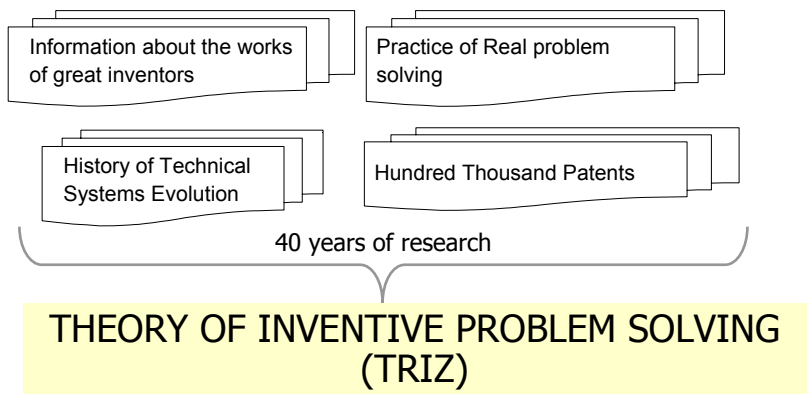

... a tool, ... a method, ...a theory...

Module 4: Theoretical grounding and principles of TRIZ

Theory of Inventive Problem Solving (TRIZ)
 is a domain of science that explores the *mechanisms of technical systems evolution* in order to develop applicable *analytical methods* and *problem solving techniques*.

where does TRIZ come from?

Module 4: Theoretical grounding and principles of TRIZ

The objective laws of Technical Systems Evolution

- ◆ Analytical methods
- ◆ Problem solving techniques
- ◆ Useful Knowledge base

history and background

First stage: "...it is necessary to study the experience of great inventors and *extract typical features of powerful solutions* in order to differentiate strong thinking."

Second stage: "...it is necessary to build a *program that performs step by step systematic analysis of the problem*, discloses, studies and overcomes technical contradictions. The program does not replace the knowledge and capacities of the inventor but provides useful problem solving tactics."

Third stage: "...it is necessary to obtain a *Theory of inventive problem solving*. This theory enables the resolution of high level problems in a systematic way. The theory has to be based on the knowledge of objective Laws of Technical Systems Evolution."

Fourth stage: TRIZ evolves into the *Theory of Technical Systems Evolution (TRTS)*. Knowledge of TRIZ spreads widely in the former Soviet Union. TRIZ starts to be applied for different non-technical systems.

Fifth stage: First publications on the Theory of Creative Personality Evolution (TRTL). Several TRIZ+ directions evolve. Worldwide spread of TRIZ.

Current stage: Application of TRIZ Concepts for non-engineering activities in the former Soviet Union. Application of TRIZ techniques and methodologies for engineering system development worldwide.

27

Levels of inventive solutions

Problems of different levels differ by the amount of trial-and-error needed to find a solution.

Why does one problem require 100 trials, and another 1,000 more?

Level One: A problem, and the means of solving it, exists within the area of one profession.

Level Two: A problem, and the means of solving it, exists within the area of one industry.

Level Three: A problem, and the means of solving it, exists within the area of one science.

Level Four: A problem, and the means of solving it, exists outside the boundaries of the science where the problem originated.

Higher sub-levels of Level Five: A problem, and the means of solving it, exists outside the boundaries of contemporary science.

Module 4: Theoretical grounding and principles of TRIZ

*G.S.Altshuller, 1969, 1973. THE INNOVATION ALGORITHM: TRIZ, systematic innovation, and technical creativity, Moscow.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

28

Levels of inventive solutions

Module 4: Theoretical grounding and principles of TRIZ

Level of the solution	Number of trials or variants are considered	Where did the solution come from	Percentage of patents in this level
I Apparent solutions	A few	The narrow specialized field	~32%
II Improvement	Dozens	A single branch of technology	~45%
III Invention inside paradigm	Hundreds	Other branches of technology	<19%
IV Invention outside paradigm	Thousands to tens of thousands	From science – little known effects and phenomena of physics, chemistry and geometry	3-4%
V Discovery	Hundreds of thousands to a million	Beyond limits of contemporary science	<0.2%

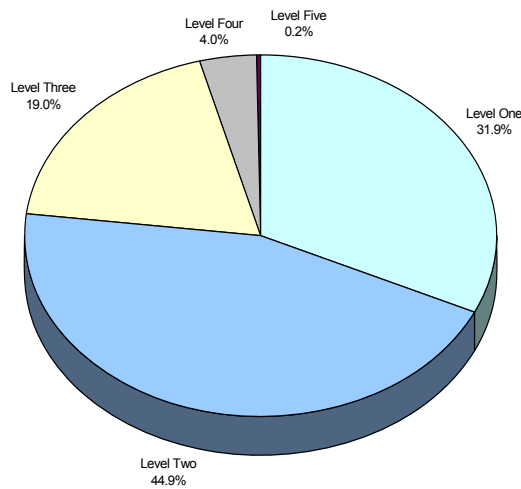

*G.S.Altshuller, 1969, 1973. THE INNOVATION ALGORITHM: TRIZ, systematic innovation, and technical creativity, Moscow.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

29

Levels of inventive solutions

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

30

first level - routine solutions

First level solutions do not consider contradictions. They are not inventions (from a TRIZ point of view). However, these solutions may be patented.

Pliers which have an increased gripping capacity due to a pincer point at the tip and a center groove located inwardly from the tip. The center groove allows for a workpiece to be deformed and therefore implicates resistance to possible shearing on separation of the workpiece from the tool. Yet the pliers possess a greater control and sensitivity when grasping very small objects, including flat sheet material, due to the pincer point on its tip.

US Patent 5572914

second level - trivial inventions

Contradictions may be considered; no knowledge required from another field of technology.

To check that a container is air-tight a tank containing liquid is used . If the container is not air-tight, we will remark bubbles after adding the liquid .

But if we have a lot of containers and tanks, the operator can miss the bubbles. How do we keep bubbles near the surface of the liquid? One attempt was to cover the surface of the liquid with glass, but this changed the level of the liquid.

Cover the surface of the liquid with a special grid. The bubbles were caught between the cells of the grid. [A.c.1193478]

third level - non trivial inventions

Contradictions are resolved by applying knowledge from another technological field.

A rotating disk is used to separate non-spherical particles from balls of the correct shape. It is proposed to install brushes under the disk. The brushes and the disk are made from dielectric materials. The brushes and the disk rub against each other.

As a result, the disk takes an electrostatic field and non-spherical particles stick to the disk. Balls are rolled faster under the action of centrifugal power.

[A.c.539517]

- 1. Brush
- 2. Disk
- 3. Feeder

- 4. Non-spherical particles collector
- 5. Balls collector

Salamatov Y.P. How to become of inventor: 50 hours of creativity. Moscow, Prosvetshenie 1990.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

33

Module 4: Theoretical grounding and principles of TRIZ

fourth level - great inventions

Contradictions are resolved using well known scientific knowledge (physical, chemical and other natural effects).

A heat pipe is a device that can quickly transfer heat from one point to another without needing any energy input. Heat pipes are often referred to as the "superconductors" of heat as they possess an extraordinary heat transfer capacity with almost no loss.

*US Patent 3229759
Grover 1/1966*

Monterrey, Mexico - INSA Strasbourg, France | July 2006

34

Module 4: Theoretical grounding and principles of TRIZ

fifth level - pioneering inventions

**Scientific knowledge is required to solve the problem.
Contradictions are resolved using recently discovered scientific effects and phenomena.**

36

Brief history of TRIZ

*...The thinking is talented when it works
according to the laws of the external world...
G. Altshuller*

- 1946 - 20 year old research officer of the Patent department (Caspian Navy) started to develop a methodology of Inventive Problem Solving.
- 1956 - first publication about the future methodology for Inventive Problem Solving in issue #6 of journal "The Problems of Psychology".
- 1961 - first book about methodology for Inventive Problem solving (50 000 copies)
- 1971- first regular Public University of TRIZ was established in Baku.
- 1981 - more than 300 TRIZ Centers in the former Soviet Union. Most TRIZ Centers were public and non profit.
- 1984 - first book in English translated from Russian G.S.Altshuller, CREATIVITY AS AN EXACT SCIENCE
- 1989 - International TRIZ Association was created in the former USSR.
- 1990 - first issue of Journal TRIZ (in Russian).
- 1994-2003 - several books about TRIZ were translated, written, and published in English, in German, in French, in Spanish, in Japanese, in Korean, and other languages...

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

37

summary

- ❑ **TRIZ is a theory that aims to study the Objective Laws of systems evolution and to propose new technologies for improving the problem solving process.**
- ❑ **TRIZ generalizes the worldwide experience of inventors and great thinkers and systematizes some useful techniques and knowledge for problem solving purposes.**
- ❑ **Instead of trying to find multiple solutions as quickly as possible, it is useful to analyze the reasons of the problem situation in order to reduce the research area, to overcome mental inertia and to satisfy conflicting requirements.**

40 INVENTIVE PRINCIPLES

Inventive Principles: a problem solving technique that is helpful for dealing with Technical Contradictions.

- ◆ Inventive principles operate with technical contradictions defined as the condition whereby *improvement* of one system characteristic results in the *degradation* of another.
- ◆ Inventive principles give general recommendations on how to change the analyzed system to eliminate contradictions.
- ◆ Inventive principles consist of a list of 40 principles with sub-principles, and a contradiction table¹ to identify useful

It is nice to catch fish and cook at the same time.

¹The Contradiction Table is formulated by placing these system characteristics in rows (under the heading "Feature to Improve") and columns ("Undesired Result").

Module 4: Theoretical grounding and principles of TRIZ

Background

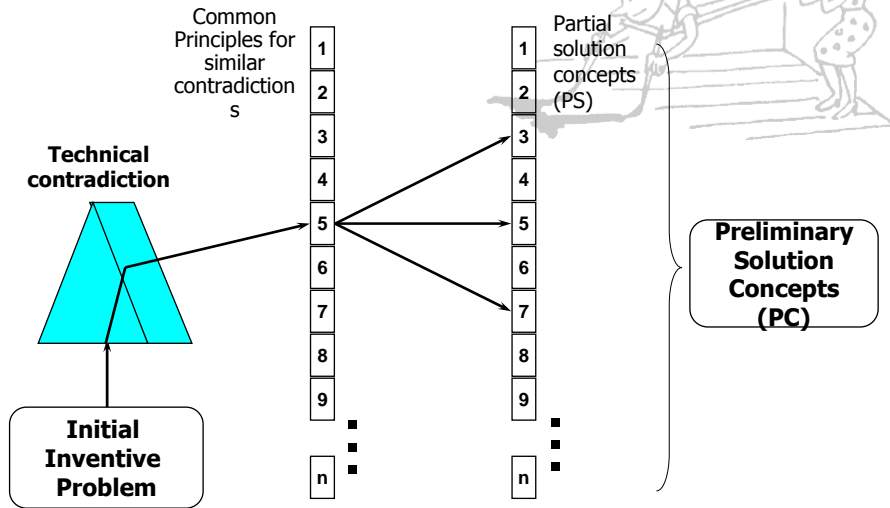

- ◆ G.S. Altshuller identified inventive principles based on his patent research (hundreds of thousands of patents were analyzed).
- ◆ The first list of inventive principles using the contradiction model was published in 1961. The first contradiction table was introduced in 1964.
- ◆ The final list of 40 inventive principles was published in 1973.
- ◆ In order to reduce the shortcomings of Inventive principles, the system of 76 Inventive standards was developed .

Field of application

Inventive Principles can be applied to synthesize solution concepts at level 2-3 and as a part of express-analysis of the problem situation.

practice: laser cutting

Image: <http://www.cuttingedgelaser.com/images/pic-laser.jpg>

During laser cutting of a metallic tube the droplets of melted metal stick to the inner surface of the tube.

It is necessary to propose a solution concept in order to remove the hardened droplets from the inner surface of the tube.

What should be done?

Problem analysis

A. The need to improve an existing system

Laser cutter main function: *to separate* parts of the tube
Anti-system main function: *to connect* parts of the tube

<p>before super-systems:</p> <ol style="list-style-type: none"> 1. Air (low t^0, low P) 2. Heavy Support 3. Other machines 4. Gravity forces 5. Old production process 	<p>super-systems:</p> <ol style="list-style-type: none"> 1. Air (t^0, P, humidity) 2. Support of machine 3. Other machines 4. Gravity forces 5. Production process 	<p>After super-systems:</p> <ol style="list-style-type: none"> 1. Air (t^0, P, humidity) 2. Support of machine 3. Other machines 4. Gravity forces 5. Efficient Production process
<p>Before system: Mechanical cutting system</p>	<p>Laser cutting system</p>	<p>After system: "Laser cutting+" system</p>
<p>before sub-systems:</p> <ol style="list-style-type: none"> 1. Cutter (saw) 2. Metallic tube 3. Filings 4. Electricity 5. Actuators 6. Control sub-system 	<p>sub-systems:</p> <ol style="list-style-type: none"> 1. Laser beam 2. Metallic tube 3. STICKY DROPLETS 4. Electricity 5. Actuators 6. CNC sub-system 	<p>After sub-systems:</p> <ol style="list-style-type: none"> 1. Laser beam 2. Metallic tube 3. Free droplets 4. Electricity 5. Actuators 6. CNC sub-system

A. the need to improve an existing system

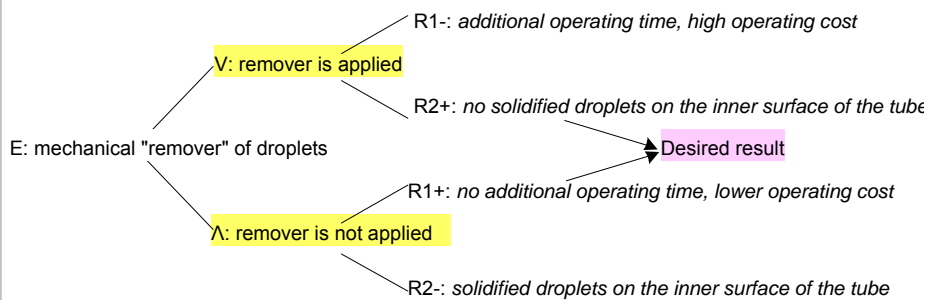

Why is it difficult to satisfy the needs using known methods?

- The hot droplets of metal stick to the inner surface of the tube during cutting.
- The chips did not stick to the surface of the tube with the previous system (mechanical cutter).
- An additional operation is required to “unstick” the droplets from the inner surface of the tube (in order to remove solidified droplets).
- It would take time and additional operating costs if a mechanical remover were used to “unstick” the droplets (the known method).
- Ideally it would be preferable if the droplets of melted metal *did not stick to the inner surface* of the tube.

B. known method leads to contradictions

Describe the mini-problem particularities

The technical system: <laser cutter> for <separating parts of the tube> consists of <laser beam, metallic tube and sticky droplets, electricity supplying system, actuators; CNC control sub-system>.

Desired result: It is necessary to achieve <no droplets on the inner surface of the tube without additional operating time and while lowering the operating cost> with minimal changes of the system.

C. Product and Tool

Choose one contradiction

The **Product** is the element that needs to be processed (manufactured, moved, changed, improved, protected from a harmful influence, revealed, measured etc.) according to the problem conditions.

The **Tool** is the element that directly interacts with the product (e.g., mill rather than a milling machine; fire rather than a burner).

Product: sticky droplets

Tool: mechanical remover

Laser cutter main function: *to separate parts of the tube*

TC-1: If there is **<a mechanical remover>**, then *<there are no solidified droplets on the inner surface of the tube>*, but *<there is additional operating time and a high operating cost>*.

TC-2: If there is **<no mechanical remover>**, then *<there is no additional operating time and a lower operating cost>*, but *<solidified droplets remain on the inner surface of the tube>*.

D. reformulate the chosen contradiction

Product: sticky droplets

Tool: absent mechanical remover

*It is necessary to improve the parameter **A** <no mechanical remover>, in order to satisfy the demands <no additional operating time and a lower operating cost>, however, the parameter **B** <solidified droplets remain on the inner surface of the tube> gets worse.*

E. identify the parameters

Module 4: Theoretical grounding and principles of TRIZ

according to analysis list of	according to generalized 39 features
the parameter to improve A	
<no mechanical cutter>	23. Loss of substance 39. Productivity
the parameter that gets worse B	
<solidified droplets remain on the inner surface of the tube>	32. Ease of manufacture 26. Quantity of substance

F. find a cell in the Contradiction Matrix

Module 4: Theoretical grounding and principles of TRIZ

- 15. DYNAMICITY
- 34. REJECTING AND REGENERATION OF PARTS
- 33. HOMOGENEITY

- 35. CHANGE OF PHYSICAL AND CHEMICAL PARAMETERS
- 38. STRONG OXIDIZERS (STRONG OXIDENTS)

G. apply Inventive Principles

To which element of the system should the recommendations of the Inventive principles be applied?

First: to conflicting elements (1) sticky droplets and (2) mechanical remover

Second: to nearest super-system of conflicting elements (1) tube; (2) laser beam; (3) air; etc.

Third: to far super-system (1) Gravity forces; (2) Others machines; (3) Production process;

15. DYNAMICITY

34. REJECTING AND REGENERATION OF PARTS

33. HOMOGENEITY

35. CHANGE OF PHYSICAL AND CHEMICAL PARAMETERS

38. STRONG OXIDIZERS (STRONG OXIDENTS)

H. gather Partial solution concepts

Direction of inventive solutions (**brief IFR**): <Droplets of melted metal> itself, without an additional cost <do not stick> to the <inner surface of the tube> within <laser cutter operating time>.

15. DYNAMICITY

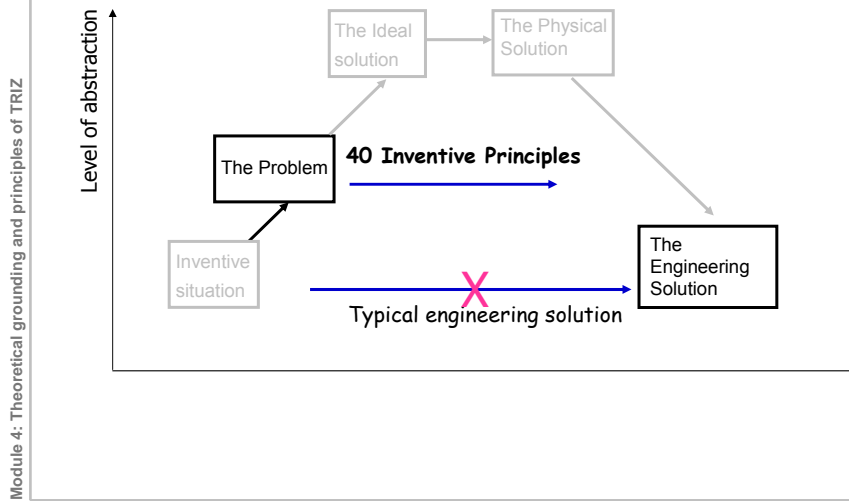

34. REJECTING AND REGENERATION OF PARTS

33. HOMOGENEITY

35. CHANGE OF PHYSICAL AND CHEMICAL PARAMETERS

38. STRONG OXIDIZERS (STRONG OXIDENTS)

From solution concepts to the solution

practice: riveted joint

Module 4: Theoretical grounding and principles of TRIZ

It is necessary to rivet two flat plates in order to make the riveted joint.

If the rivet is deformed enough, the plates are well fixed, but cannot work as a joint. If the rivet isn't deformed enough, the plates are movable, but they aren't adjusted enough.

How should the rivet joint be manufactured ?

Problem analysis

Module 4: Theoretical grounding and principles of TRIZ

THREE BASIC CONCEPTS*

How do we look for the solution to a problem?

1. Idea of Objective Laws of Systems evolution

- Objective laws of systems evolution exist. These Laws can be discovered, studied and purposefully applied for problem solving without resorting to a search for variants.

2. Idea of Contradiction as a problem cause

- During their evolution the systems overcome the contradictions between objective restrictions and specific situation limits.

3. Idea of Particular situation conditions

- Every problem can be solved only for particular situation conditions, using available resources.

*© N.Khomenko. 1997-2001. Materials for seminars: OTSM-TRIZ: Main technologies of problem solving. "Jonathan Livingston" Project.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

67

LAWS OF SYSTEMS EVOLUTION: an example

Logistic equation:

Life curve of systems

$$P(t) = a \frac{1 + me^{-e/\tau}}{1 + ne^{-e/\tau}}$$

The logistic equation as a model of population growth was introduced by Belgian mathematician Pierre-Francois Verhulst (1804-1849) in 1838 .

Verhulst derived his logistic equation after he had read 'An essay on the Principle of Population' of English demographer and political economist Thomas Malthus (1766-1834) .

The logistic equation was introduced to describe the self-limiting growth of a biological population.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

68

Life curve of technical systems

- Growth curve
- Sigmoid curve
- Logistic curve
- S-curve
- Pearl Curve

It is useful to depict a system's position on an S-curve in order to take a decision about the direction of problem solving.

S-curve of heat engines evolution

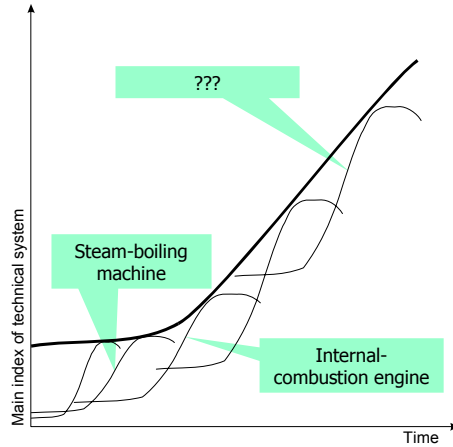

Phases of evolution:

- I. birth, childhood;
- II. adolescence;
- III. maturity and decline.

- What phase is the system currently in?
- What form of creative thinking is required?
- How do we know when the rules of survival have changed?

Combination of S-curves

**Why does
"system 2"
replace
"system 1"
?**

Several evolution curves for technical systems with different working principles.

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

71

Increasing Ideality

During their evolution the technical systems tend to improve the ratio between the SYSTEM PERFORMANCE and the EXPENSE required to achieve this performance.

$$I = \frac{\sum P}{\sum E} \quad \begin{matrix} \text{(performance)} \\ \text{(expense)} \end{matrix}$$

Useful for practice*:

Ideal machine – there is no machine, but the required action is performed.

Ideal process – there are no energy expenses and no time expenses, but the required action is performed (self-acting control).

Ideal substance – there is no substance, but the function is performed.

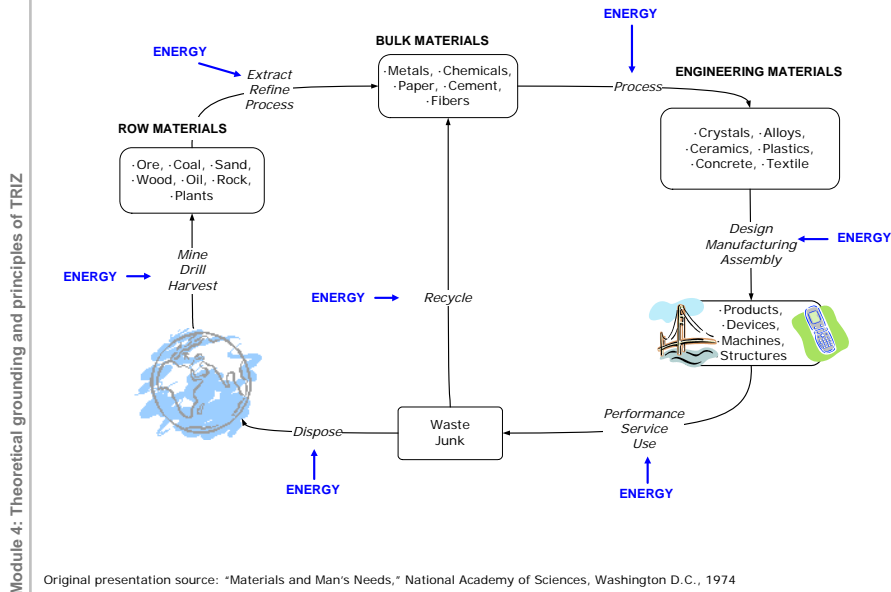

Module 4: Theoretical grounding and principles of TRIZ

*G.S.Altshuller: 1979. CREATIVITY AS AN EXACT SCIENCE. Sovetskoe radio, Moscow

Monterrey, Mexico - INSA Strasbourg, France | July 2006

72

definition of expenses (substances, energy)

Monterrey, Mexico - INSA Strasbourg, France | July 2006

73

classic system of Laws of Technical Systems Evolution

Laws of Technical Systems Evolution describe fundamental, firm, and repeating relationships of system elements and the external environment during their evolution.

- *law of System Completeness*
- *law of Energy Conductivity in systems*
- *law of Harmonization*

- o law of Dynamics Growth
- o law of Increasing Substance-Field Interactions
- o law of Irregularity of the Evolution of a System's Parts
- o law of Transition from Macro- to Micro-level
- o law of Transition to the Super-system

✓ LAW OF INCREASING IDEALITY

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

74

CONTRADICTION AS A PROBLEM CAUSE

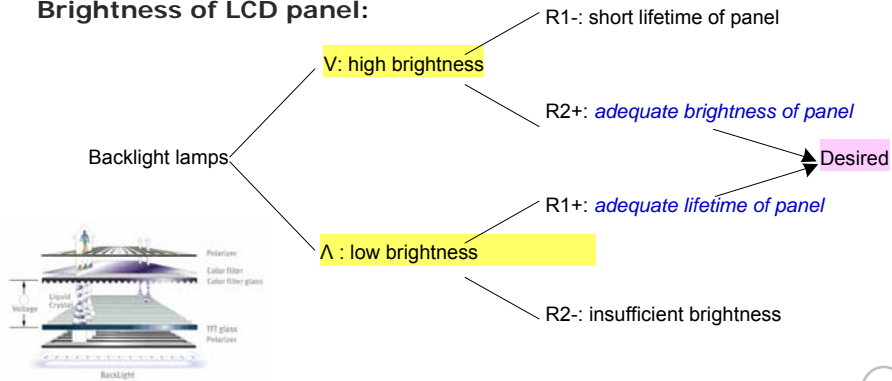

During their evolution systems overcome the contradictions between objective restrictions and specific situation limits.

Practical conclusion for problem solving:

A powerful solution must overcome one or several contradictions.

Module 4: Theoretical grounding and principles of TRIZ

Brightness of LCD panel:

types of contradiction models

Administrative contradiction (initial situation)

we know what is required, but we do not know how to achieve that.

Vacuum cleaner produces a lot of noise (>60dB).
How to reduce the noise's level of a vacuum cleaner?

Technical contradiction

we know how to achieve the required result, but it will make the system worse.

TC-1: If there are <few damping materials>, then <the suction power is sufficient>, but <the noise level is high>.
TC-2: If there are <added damping materials>, then <the noise level is low>, but <the suction power is not acceptable; dimensions of the vacuum cleaner are large, temperature of the fan-motor increases>.

Physical contradiction

we know what is required and how it has to work but we do not know the working principle.

<Air flow> has to be <small and laminar>, to <decrease noise>
<Air flow> has to be <large and turbulent>, to <provide effective suction>

Module 4: Theoretical grounding and principles of TRIZ

shape of the Earth

Module 4: Theoretical grounding and principles of TRIZ

lost spacecraft

Module 4: Theoretical grounding and principles of TRIZ

PARTICULAR SITUATION CONDITIONS

Every problem can be solved only for particular situation conditions, using available resources.

Practical conclusion for problem solving:

A powerful (useful, breakthrough) solution uses, first of all, the resources available in the conditions of its particular situation.

SUBSTANCE - solid, liquid, gas, plasma substance.

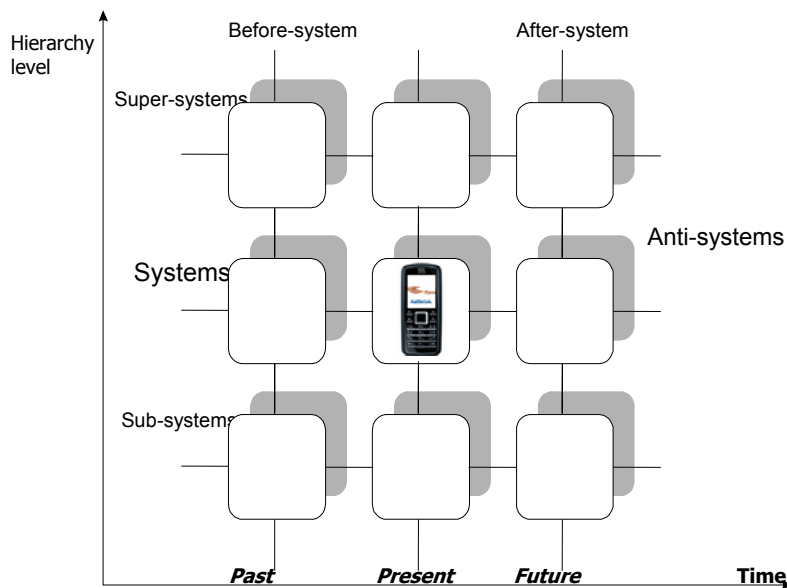

FIELD - mechanical, acoustical, thermal, chemical, electrical, magnetic, electromagnetic fields, etc.

SPACE - empty space, artificial and natural void, permanent or temporary void.

TIME - time before problem occurs, time of conflict, time after conflict.

Module 4: Theoretical grounding and principles of TRIZ

Multi-screen thinking (how to look for resources?)

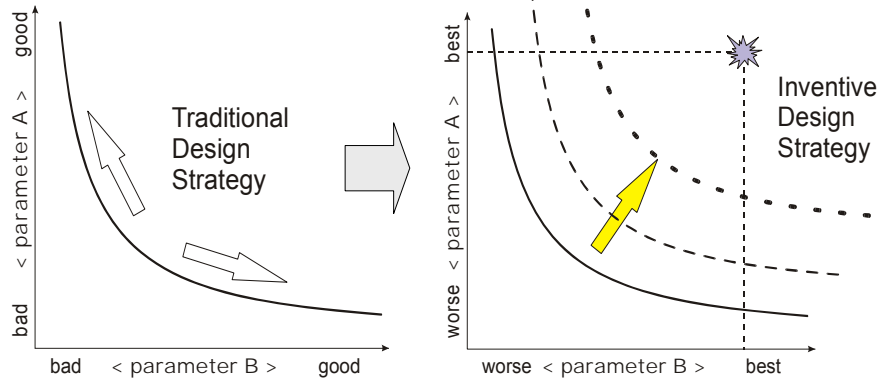

Module 4: Theoretical grounding and principles of TRIZ

inventive vs. robust

...Nature of innovation is to discover what you don't know...

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

81

Welding of two glass plates

Module 4: Theoretical grounding and principles of TRIZ

In order to assemble two glass panels hot air is used to heat their surfaces. It is necessary to detect precisely when the surfaces begin to melt ("flow point") and to push them together at this moment.

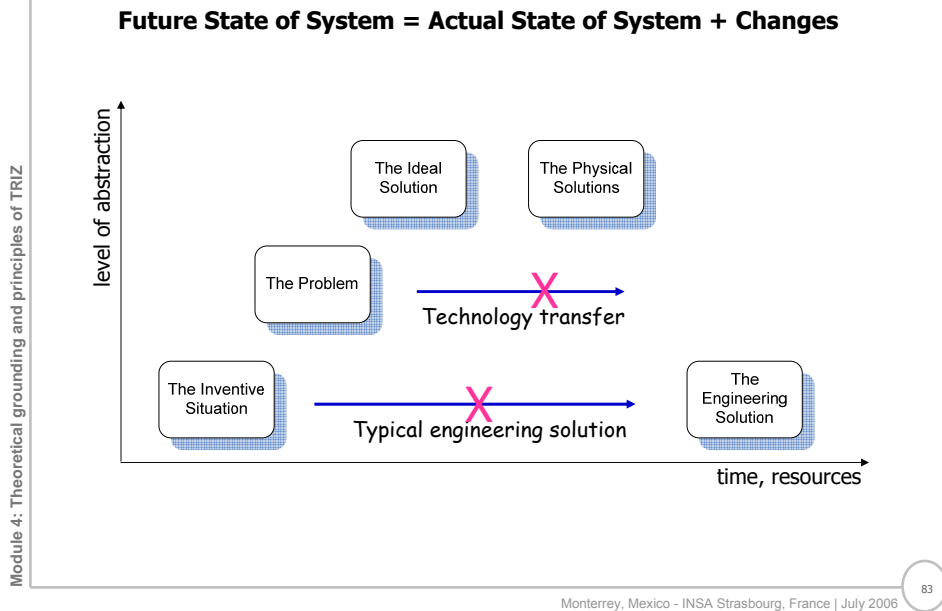

It is necessary to propose a device that detects the melting moment of the entire surface with a high degree of accuracy.

G.I.Ivanov: 1994: THE FORMULES OF CREATIVITY OR HOW TO LEARN TO INVENT. Prosveschenie, Moscow. P. 107

Monterrey, Mexico - INSA Strasbourg, France | July 2006

82

process of solving an inventive problem

Summary

- ❑ **TRIZ is a theory that aims to use the objective laws of systems evolution in order to improve the problem solving process.**
- ❑ **A principal feature of talented thinking is the ability to easily “travel” between system, super-system, and subsystem levels as well as between past, present, and future stages.**
- ❑ **The problem solving process might be subdivided into 5 stages:**
 1. Initial situation analysis: to extract a problem;
 2. Problem definition stage: to formulate the problem as a contradiction;
 3. Ideal Final Result definition stage: to fix the problem solving direction and to disclose the physical contradiction;
 4. Physical solution development: to develop feasible ideas;
 5. Engineering solution development: to develop a practical solution out of feasible ideas.

Mental inertia & creative imagination

Psychological barriers include several layers:

- the specific terms;
- well known typical solutions from professional practice;
- nonflexible viewpoint of the problem situation;
- desire to obtain a solution as soon as possible...

complicated by words

Let's assume that 300 electrons, in several groups, must jump from one energetic level to another. However, a quantum transfer has already taken place by two groups less than were originally calculated; consequently, each group now has five more electrons. How many electron groups were there in total?

To send 300 scouts to summer camp, several buses were reserved; however, two buses did not show up at the required time. Therefore, each bus took five scouts more than was planned.

How many buses were sent?

*What does it mean?
I am not a specialist!*

I just need some knowledge in math!

mental inertia...: how to apply words?

Instead of names and terms it is helpful to use the *functional "name"* or general description + key feature

Module 4: Theoretical grounding and principles of TRIZ

Specific name / term	<u>Function</u> / feature	"name"
Water-purification filter	To clean water	"Cleaner"
Sulfuric acid		
Book		
Hammer		
Chair		
Computer display		
Mobile phone		

Monterrey, Mexico - INSA Strasbourg, France | July 2006

87

function definition

How do we define the function of a system?

1. Describe a function using common words and expressions
pencil – to write, to draw
2. Reformulate the defined function in accordance with the pattern:
<verb> + <subject/noun> + <..additives/object..>
<draw> <letters>; <supply> <ink>
3. Reformulate the defined function according to the pattern:
<change> + <features (values)>
<change> <color>

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

88

mental inertia...: anchor

It is necessary to anchor a boat in open sea. However, the seabed is stony and level. A classic anchor doesn't work properly.

What should be done?

...and creative imagination

*Whatever a human being
can imagine,
others can make reality.*
Jules Verne

What are the applicable approaches from TRIZ to scaffold creative imagination and overcome the limitations of mental inertia?

- Multi-screen scheme of talented thinking
- Size-Time-Cost operators
- Simulation with Little Creatures
- "Golden Fish" operator...

The creative imagination approaches do not work in isolation! They are efficient in combination with analytical methods, techniques and knowledge base.

size-time-cost operators

What would happen to the problem situation, the features of objects and its environment if we were to increase or decrease the values of an object's parameters by many times (by 10, 100, 1000 times)?

It is necessary to remove a 3000 kg metallic cone from a river. The river has a stony bed and a fast current. What should be done?

Size:

- increase it from its real size to infinity step by step AND/OR
- decrease it from its real size to zero step by step;

Time (operation or conflict time):

- increase it from its real time to infinity step by step AND/OR
- decrease it from its real time to zero step by step;

Cost (operation):

- increase it from its available cost to infinity step by step AND/OR
- decrease it from its available cost to zero step by step.

*A.V.Podkatilin. Basics of Engineering creativity. Moscow 1997.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

91

PROBLEM SOLVING PROCESS

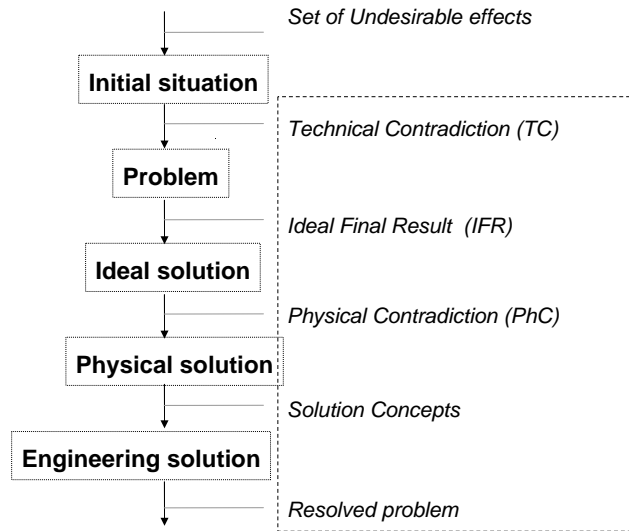

1. Initial situation analysis:
to extract a problem.
2. Problem definition stage:
to formulate a problem as a contradiction.
3. Ideal Final Result definition stage:
to fix the problem solving direction and to disclose the physical contradiction.
4. Physical solution development:
to develop feasible ideas.
5. Engineering solution development:
to develop a practical solution out of feasible ideas.

Monterrey, Mexico - INSA Strasbourg, France | July 2006

93

How to increase brightness of a LCD display?

Initial situation:

To backlight liquid crystal displays fluorescent lamps are applied. For displays larger than 12", in order to improve the brightness of the display, two lamps are installed on both sides of the display. In order to improve the homogeneity of the backlight a set of special sheets are applied.

It is necessary to improve the brightness of the LCD display by 20%.

What should be done?

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

94

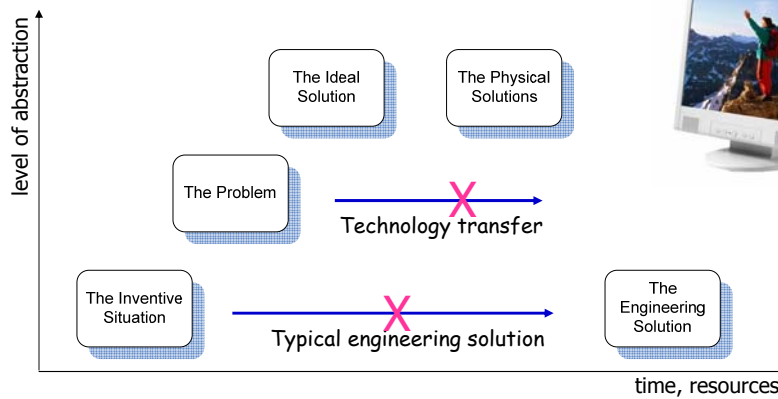

Initial situation

Discontent is the first necessity of progress.

Thomas A. Edison

The problem situation is recognized when there is no known method for satisfying needs. We know what is required, but we do not know how to achieve that.

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

95

Problem definition

We fail more often because we solve the wrong problem than because we get the wrong solution to the right problem. Russell Ackoff

Some typical (known) engineering solutions such as "install a brighter lamp" are not acceptable.

Module 4: Theoretical grounding and principles of TRIZ

Pattern:

TC-1: If there is <V>, then <P1->, but <P2+>

TC-2: If there is <A>, then <P1+>, but <P2->

Monterrey, Mexico - INSA Strasbourg, France | July 2006

96

Problem situation description

Main function of LCD panel:

The technical system: <LCD panel> for <_____> consists
<_____, _____, _____>
<_____, _____, _____>

TC-1: If there is <_____>, then
<_____>,
but <_____>.

TC-2: **If there is** <_____>, **then**
<_____>, **but**
<_____>.

It is necessary* to
<_____> with minimal
changes of the system.

* desired result

Monterrey, Mexico - INSA Strasbourg, France | July 2006

97

What to do with contradictions?

1. IDENTIFY the elements that are responsible for the contradiction:

_____ (Product); _____ (Tool)

2. CHOOSE one contradiction that corresponds to the main function of system efficiency <_____>:

3. INTENSIFY CHOSEN CONTRADICTION:

Monterrey, Mexico - INSA Strasbourg, France | July 2006

98

Problem model

...A problem well stated is a problem half-solved...

- (1) *Conflicting pair*: < _____ > and
< _____ >
- (2) *Intensified Conflict*: < _____ > do not
< _____ >, but they do not
< _____ >.
- (3) *Problem*: It is necessary to find such an **X-element** that
< _____ > do not < _____ >,
and < _____ >.

What is an Ideal solution?

*Think of the end before the beginning.
Leonardo Da Vinci*

Ideal machine – there is no machine, but the required action is performed.

Ideal process – there are no energy expenses and no time expenses, but the required action is performed (self-acting control).

Ideal substance – there is no substance, but the function is performed.

Simplified pattern for Ideal Final Result (IFR):

X-element, *itself*, *without harmful side effects*, eliminates

< *indicate the harmful action* >

and keeps the ability to provide

< *indicate the useful action* >.

Ideal Final Result

How do you start such a puzzle?

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

101

What is a Physical solution?

Description of concepts (ideas) which answers the formulated contradiction and does not conflict with laws of Nature.

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

102

What is an Engineering solution?

The only difference between a problem and a solution is that people understand the solution.
 Charles Kettering

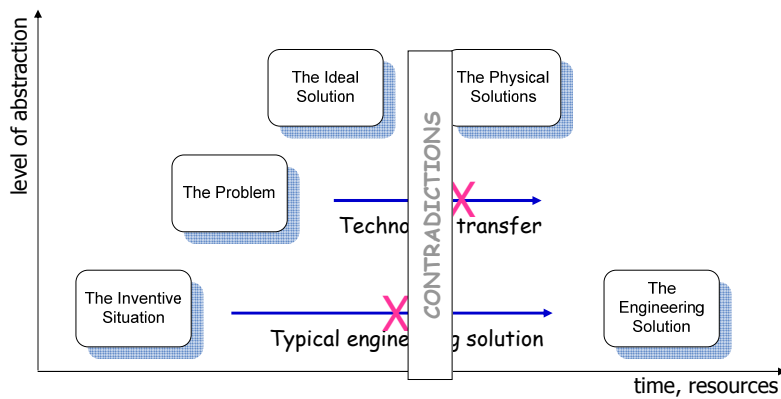

Detailed description of concepts (ideas) which answers the formulated contradiction and does not conflict with specific situation restrictions.

Module 4: Theoretical grounding and principles of TRIZ

summary

The contradiction model is applied to reduce the research area effectively and to take into account all major restrictions.

The direct route isn't always shorter!

Example of a patent: Pizza box

Module 4: Theoretical grounding and principles of TRIZ

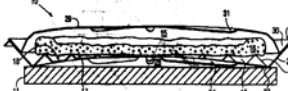

United States Patent (54) Patent Number: 5,423,477
 (51) Int. Cl. 7: B65D 21/00
 (52) U.S. Cl. 206/200

Abstract:
 A pizza box having a top and bottom with flaps of a single layer of thermoplastic, heat-sealable material, such as polypropylene. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface. Additional features include a closed heating chamber within an inner protrusion and a protrusion on the top surface of the bottom flap. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface. Additional features include a closed heating chamber within an inner protrusion and a protrusion on the top surface of the bottom flap. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface.

United States Patent (54) Patent Number: 5,472,139
 (51) Int. Cl. 7: B65D 21/00
 (52) U.S. Cl. 206/200

Abstract:
 An improved method for storing and transporting a hot pizza includes a top and bottom with flaps of a single layer of thermoplastic, heat-sealable material, such as polypropylene. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface. Additional features include a closed heating chamber within an inner protrusion and a protrusion on the top surface of the bottom flap. The top and bottom flaps are joined to one another between the top and bottom flaps and the bottom flaps are joined to one another between the bottom flaps and a heating surface.

Example of a patent: Flip-Up flash

Module 4: Theoretical grounding and principles of TRIZ

United States Patent (54) Patent Number: 5,397,105
 (51) Int. Cl. 7: G03B 13/02
 (52) U.S. Cl. 348/200

Abstract:
 In a camera system having a flash unit that is flipped up from the camera body for use as a flip-up flash. The flash unit is mounted on the camera body and is automatically extended from the camera body in a substantially vertical direction to a position above the lens of the camera body. The flash unit is flipped up and automatically extended from the camera body in a substantially vertical direction to a position above the lens of the camera body.

Flip-Up Flash
 Still one of the best ways to reduce red eye. Also prevents accidentally blocking the flash with your hands

Autofocus
 Camera autofocuses the lens for sharp pictures from 2.5 ft (0.8m) to infinity

typical structure of a project team

- *Team leader to manage the project.*
- *TRIZ experts.* Requirements: previous consulting experience of minimum 4 years, experience in teaching TRIZ is a plus.
- *Experts in the particular problem situation.* Requirements: previous engineering experience of minimum 3 years, experience in new product development is a plus, motivation to solve inventive and innovative problems, awareness of competitive products.
- *A professional physicist (optional) (or an engineer with a degree in physics).* Requirements: a wide background in different branches of physics, used to working in a corporate environment, familiar with engineering, motivation to solve inventive and innovative problems.
- *Marketing specialist (optional).* Requirements: familiar with the marketing of engineering products and with the situation of the Customer's market, engineering degree is preferable.
- *It is preferable to have the possibility of inviting external experts.*

Module 4: Theoretical grounding and principles of TRIZ

Monterrey, Mexico - INSA Strasbourg, France | July 2006

109

comparison of various TRIZ-techniques

(rough estimate*)

40 Inventive Principles

- for practical mastery: two-day course + 10-20 hours of practice
- duration of resolution process - several working hours.

76 Inventive Standards

- for practical mastery: three-day course + 25-30 hours of practice;
- duration of resolution process - several working hours

Altshuller's ARIZ

- for practical mastery: at least ten-day course + 100-200 hours of practice;
- duration of resolution process: from tens to hundreds of working hours.

Module 4: Theoretical grounding and principles of TRIZ

* G.S. Altshuller, et al. 1989, SEARCH FOR NEW IDEAS: FROM INSIGHT TO TECHNOLOGY. Kartya Moldovenyaska Publishing House, Kishinev.
